My research:

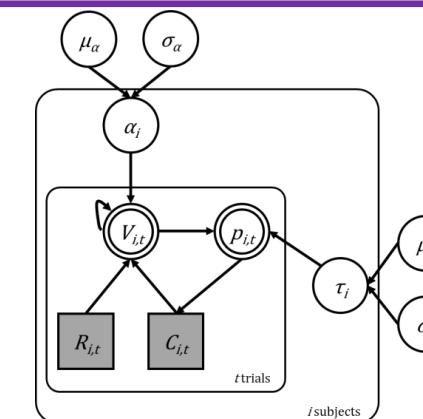

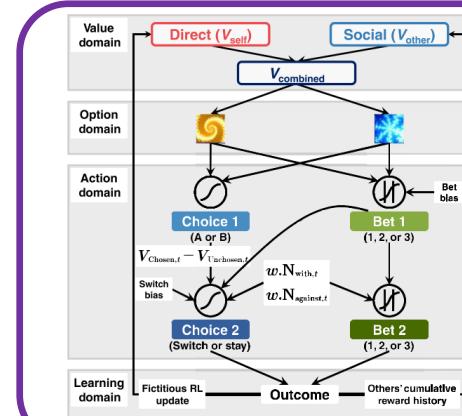

- I ask people to make decisions

Computation

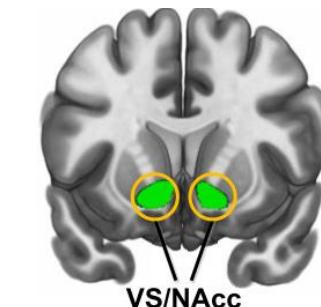

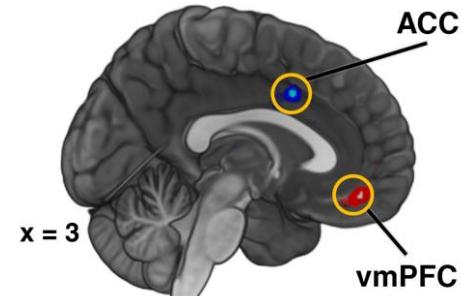

- I build computational models

Algorithm

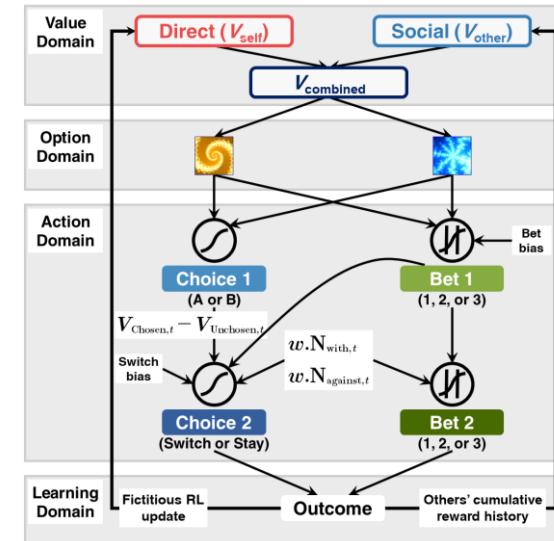

- I examine neural mechanisms

Implementation

• My journey through computational modeling

- Started with MLE (@fminsearch in Matlab)
- Switched to Bayesian: first JAGS, then Stan
- Why switching to Stan? Look at Fig. 2A and Table S3 in [Zhang & Gläscher \(2020\)](#)

$$\begin{aligned}
 V_{self,t} &= [V_{self,t}(A), V_{self,t}(B)] \\
 V_{other,t} &= [V_{other,t}(A), V_{other,t}(B)] \\
 V_t &= \beta_{self} V_{self,t} + \beta_{other} V_{other,t} \\
 C1_t &\sim \text{Categorical}(\text{Softmax}(V_t)) \\
 U_{bet1,t} &= \beta_{bias_{self}} + \beta_{val_{self}}(V_{Chosen,C1,t} - V_{Unchosen,C1,t}) \\
 B1_t &\sim \text{OrderedLogistic}(U_{bet1,t} | \theta) \\
 w.N_{against,t} &= \sum_{k=1}^K w_{k,t}, K = 0, 1, \dots, 4 \\
 w.N_{with,t} &= \sum_{k=1}^{t-K} w_{k,t} \\
 w.N_{with,t} &= \frac{\sum_{k=1}^K w_{k,t}}{\sum_{k=1}^{t-K} w_{k,t}} \\
 V_t(\text{switch}) &= \beta_{bias_{self}} + \beta_{val_{self}}(V_{Chosen,C1,t} - V_{Unchosen,C1,t}) + \beta_{against} w.N_{against,t} \\
 C2 &\sim \text{Bernoulli}(V_t(\text{switch})) \\
 U_{bet2,t} &= U_{bet1,t} + \beta_{with_{self}} w.N_{with,t} + \beta_{against_{self}} w.N_{against,t}, \text{ if } C1 = C2 \\
 B2_t &\sim \text{OrderedLogistic}(U_{bet2,t} | \theta) \\
 \Phi(x) &= \frac{1}{1+e^{-x}} \\
 \delta_{self, chosen, C1,t} &= R_{self,t} - V_{self, chosen, C1,t} \\
 \delta_{self, unchosen, C1,t} &= -R_{self,t} - V_{self, unchosen, C1,t} \\
 V_{self, chosen, C1,t+1} &= V_{self, chosen, C1,t} + \alpha \delta_{self, chosen, C1,t} \\
 V_{self, unchosen, C1,t+1} &= V_{self, unchosen, C1,t} + \alpha \delta_{self, unchosen, C1,t}
 \end{aligned}$$

Goal of this tutorial

- Refresher of Bayesian statistics
- Practical model-building in **Stan**, at least for one subject
- (Enough) theory to ground you
- Obtain **keywords/pointers** to google for your research in the future

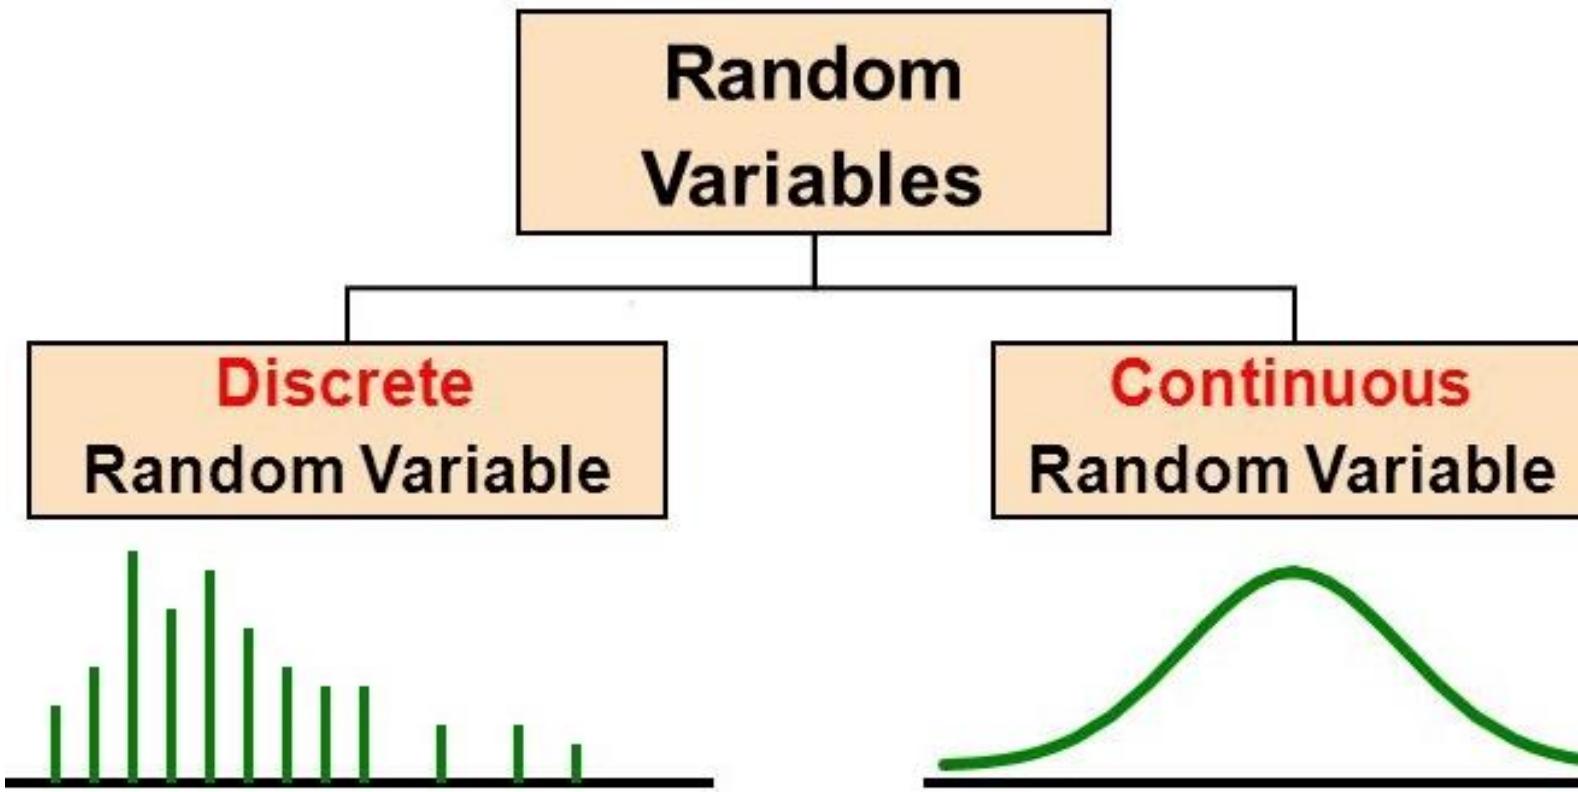

Outline

- Recap on Bayesian modeling
- Why Stan?
- What is (computational) cognitive modeling?
- The idea of the simple RL model
- Implementing RL model for one subject in Stan
- Fitting multiple subjects with the hBayesDM package
- Q&A

Probability Functions

Σ

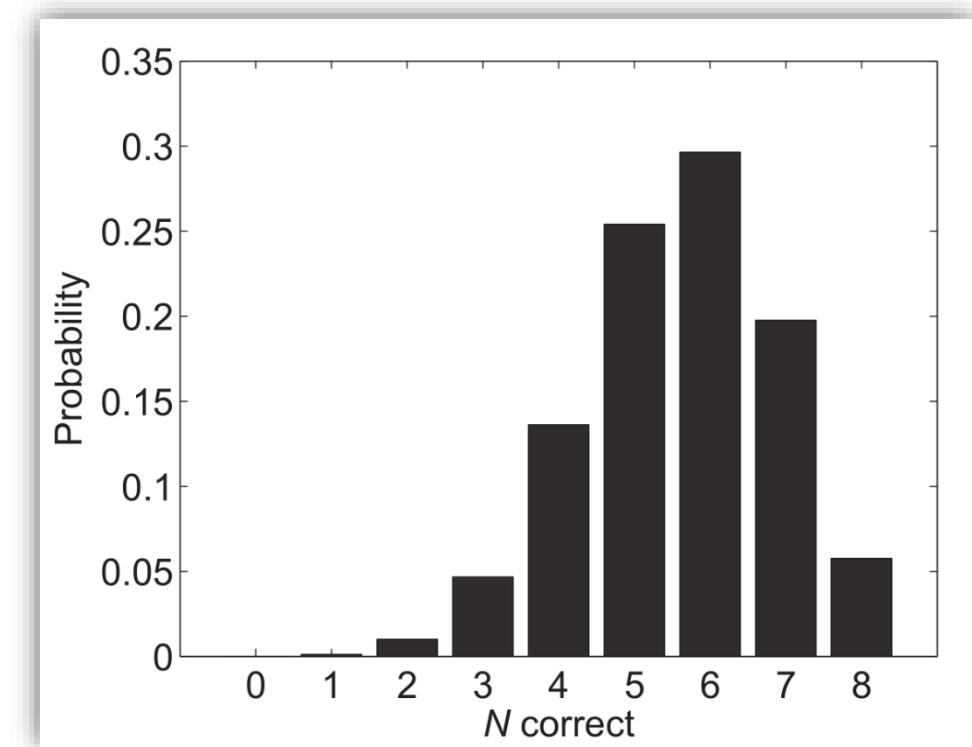

\int

Probability Functions

discrete variable – we talk about **mass**

- Run a test of 8 questions, and record each student's correct responses
- Count and plot the # of correct answers
- Then divide those counts by the total number of students
- The lengths of these bars sum up to 1

Probability Functions

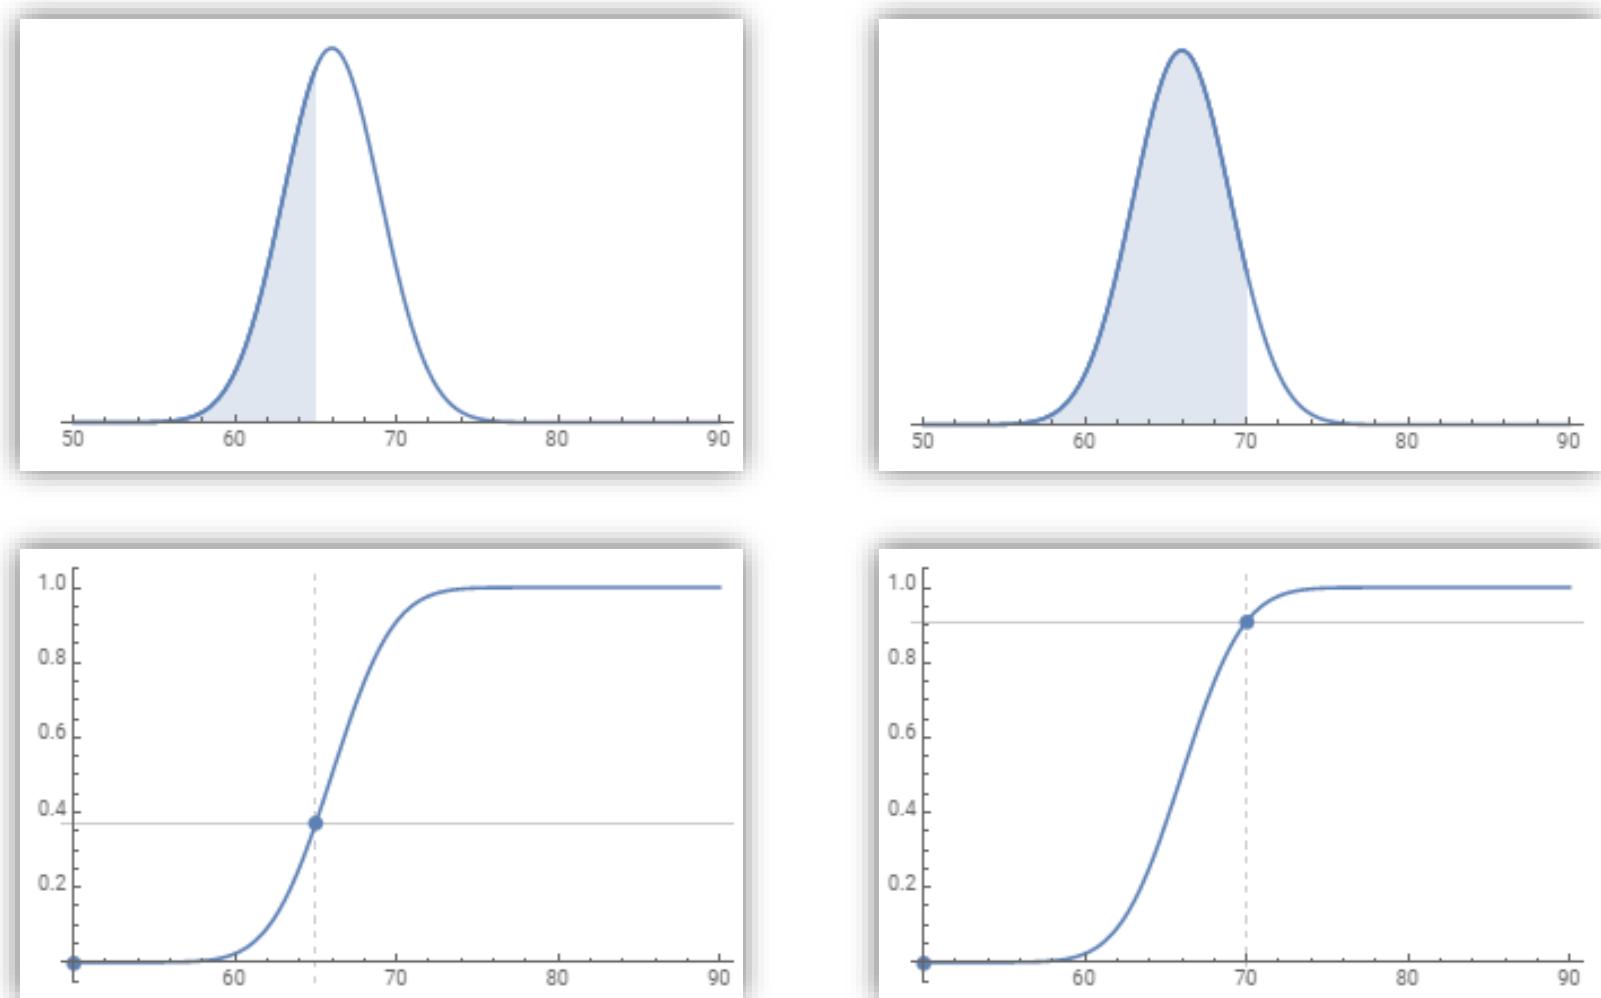

continuous variable – we talk about **density**

probability density function
(PDF)

The entire area under the curve
of PDF is 1.

cumulative distribution function
(CDF)

Joint, Marginal and Conditional Probability

Joint Probability

$$p(A, B) = p(B, A)$$

- e.g., $p(\text{rain, cold})$: $p(\text{rain})$ AND $p(\text{cold})$

Marginal Probability

$p(A)$ – ‘ p of A irrespective of B’

- e.g., $p(\text{rain})$: $p(\text{rain, cold}) + p(\text{rain, not cold})$

Conditional Probability

$p(A|B)$ – ‘ p of A given B’ – event B is fixed, not uncertainty

$$p(A,B) = p(A|B)p(B)$$

- e.g., $p(\text{rain, cold}) = p(\text{rain}|\text{cold})p(\text{cold})$

Example: discrete

Joint probability :

$$P(X = 0, Y = 1) =$$

$$\sum_{x,y} P(X = x, Y = y) = 1$$

		snow	
		1	0
cold	1	0.5	0.1
	0	0.1	0.3

Marginal probability :

$$P(Y = 1) =$$

$$P(X = 0) =$$

Conditional probability :

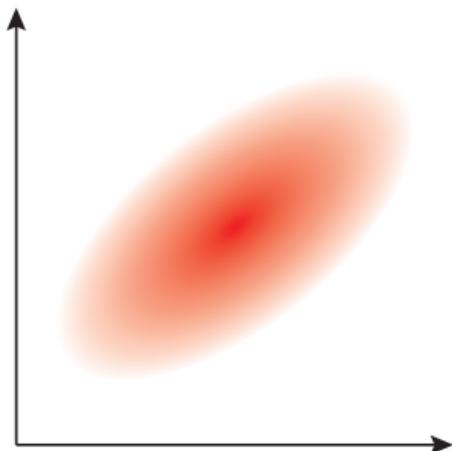

$$P(X = 1|Y = 1) =$$

$$P(X = x) = \sum_y P(X = x, Y = y)$$

$$P(X = x|Y = y) = \frac{P(X = x, Y = y)}{P(Y = y)}$$
$$= \frac{P(X = x, Y = y)}{\sum_x P(X = x, Y = y)}$$

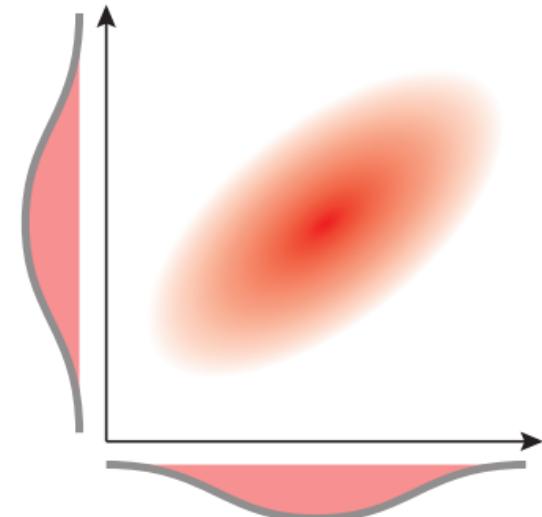

Example: continuous

joint distribution

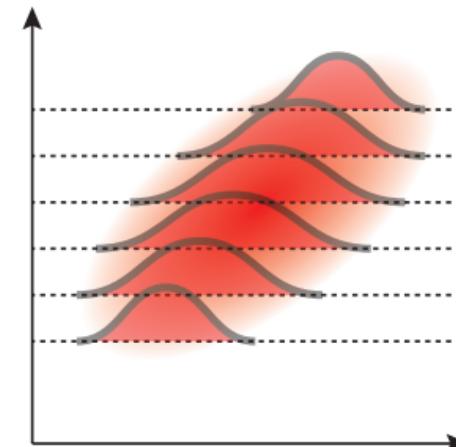

The “co-distribution” of x and y .

marginal distribution

The density of x - (or y -) values,
without knowing the other's value.

conditional distribution

The probability distribution of x ,
given that we know the value of y .

Bayes' theorem

$$p(A,B) = p(B,A)$$

$$p(A,B) = p(A|B)p(B)$$

$$p(B,A) = p(B|A)p(A)$$

$$p(A|B)p(B) = p(B|A)p(A)$$

$$p(A | B) = \frac{p(B | A)p(A)}{p(B)}$$

Linking Data and Parameter

$$p(A|B) = \frac{p(B|A)p(A)}{p(B)}$$

A diagram illustrating the components of the conditional probability formula. Two blue arrows point from labels θ and D towards the term $p(A|B)$ in the equation.

Linking Data and Parameter

$$p(\theta|D) = \frac{p(D|\theta)p(\theta)}{p(D)}$$

Linking Data and Parameter

Likelihood

How plausible is the data given our parameter is true?

Prior

How plausible is our parameter before observing the data?

$$p(\theta|D) = \frac{p(D|\theta)p(\theta)}{p(D)}$$

Posterior

How plausible is our parameter given the observed data?

Evidence

How plausible is the data under all possible parameters?

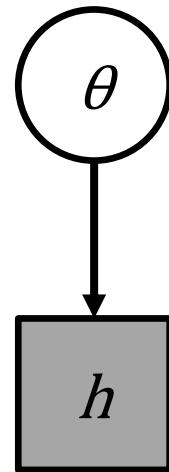

Bernoulli Model

- You are interested in if a coin is biased.
- You will flip the coin.
- You will record whether it comes up a head (h) or a tail (t).
- You might observe 15 heads out of 20 flips.
- What is your degree of belief about the biased parameter ϑ ?

Bernoulli Model

$$p(h \mid \theta) = \theta^h (1 - \theta)^{1-h}$$

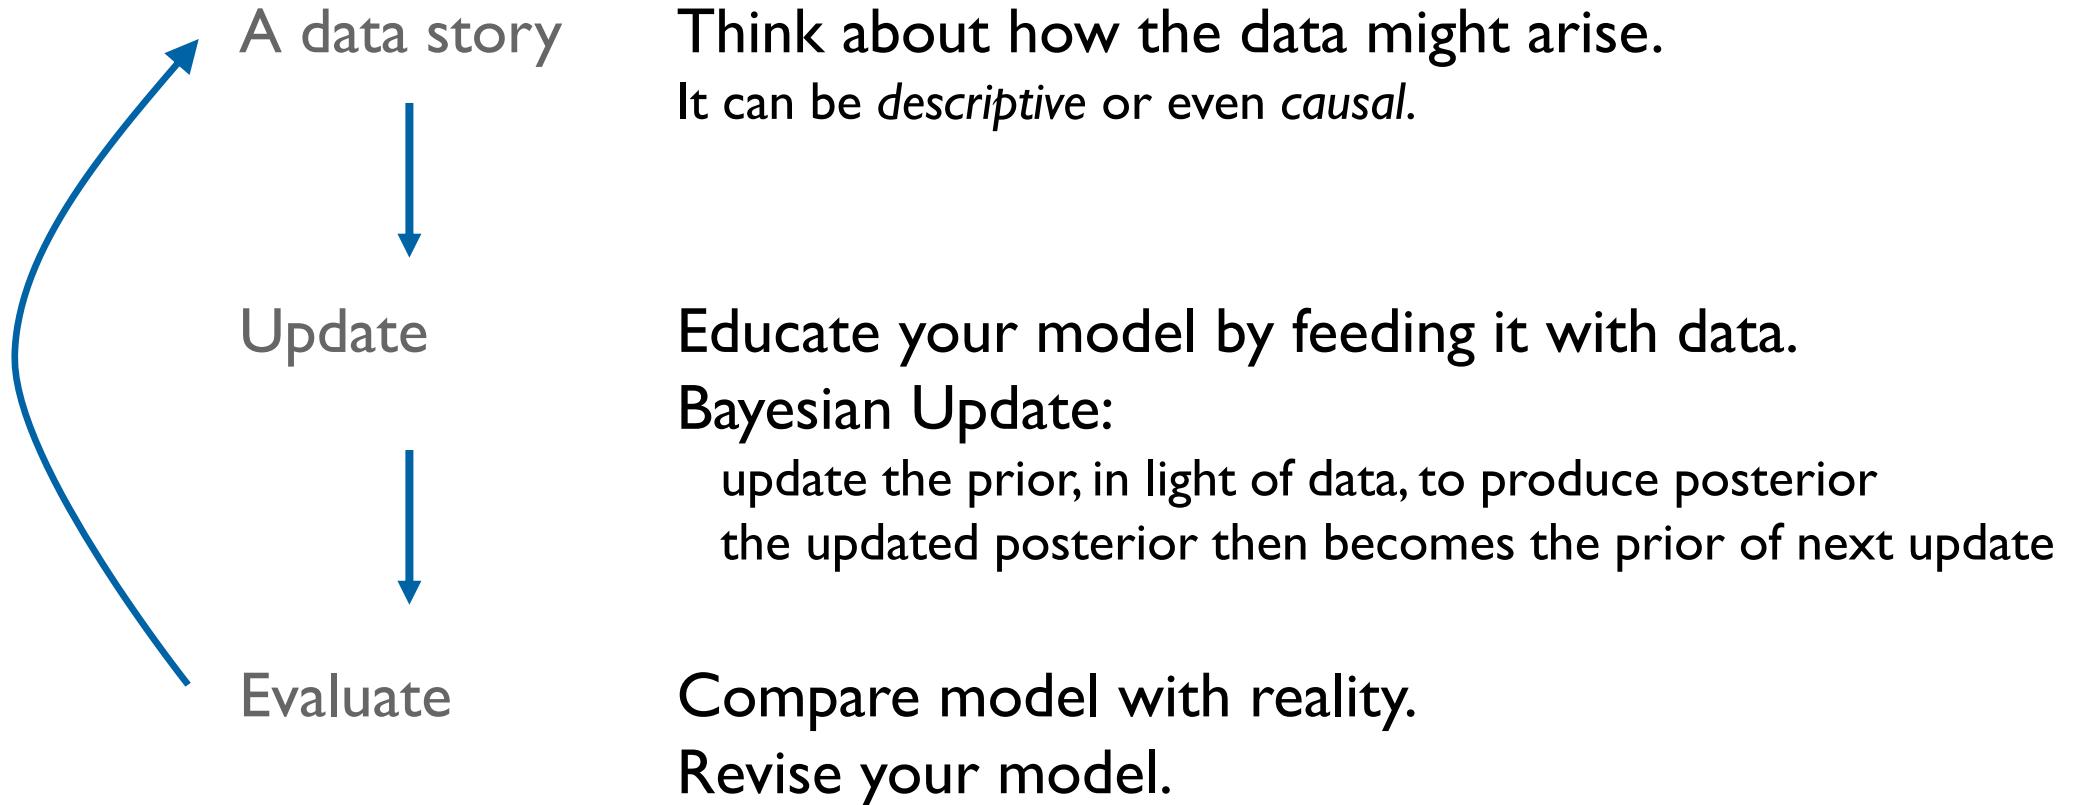

$\theta \sim \text{Uniform}(0, 1)$

$h \sim \text{Bernoulli}(\theta)$

	continuous	discrete
unobserved	θ	δ
observed	y	N

Steps of (Bayesian) Modeling?

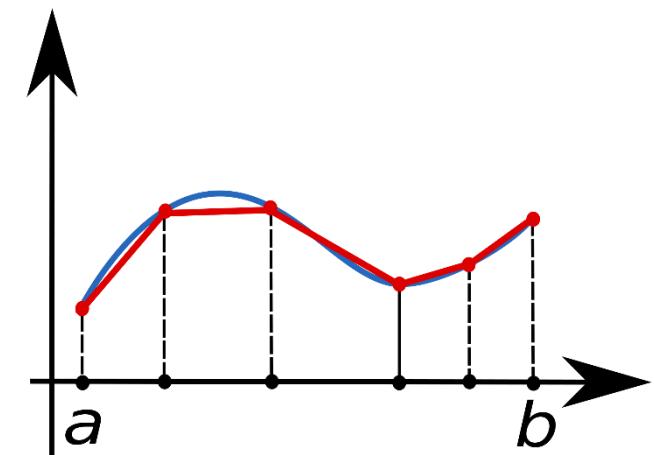

Solve it by Grid Approximation

discrete parameters

$$p(\theta | D) = \frac{p(D | \theta)p(\theta)}{\sum_{\theta^*} p(D | \theta^*)p(\theta^*)}$$

continuous parameters

$$p(\theta | D) = \frac{p(D | \theta)p(\theta)}{\int p(D | \theta^*)p(\theta^*)d\theta^*}$$

What if I have multiple parameters?

grid approximation for
2 parameters?
5 parameters?
10 parameters?

$$p(\theta | D) = \frac{p(D | \theta) p(\theta)}{\int p(D | \theta^*) p(\theta^*) d\theta^*}$$

$$p(data) = \int_{\text{All } \theta_1} \int_{\text{All } \theta_2} p(data, \theta_1, \theta_2) d\theta_1 d\theta_2$$

$$p(data) = \int_{\mu_1} \int_{\sigma_1} \dots \int_{\mu_{100}} \int_{\sigma_{100}} \underbrace{p(data | \mu_1, \sigma_1, \dots, \mu_{100}, \sigma_{100})}_{\text{likelihood}} \times \underbrace{p(\mu_1, \sigma_1, \dots, \mu_{100}, \sigma_{100})}_{\text{prior}} \\ d\mu_1 d\sigma_1 \dots d\mu_{100} d\sigma_{100},$$

- Analytical solutions (often does not exist)
- Grid approximation (takes too long)
- solution: **Markov Chain Monte Carlo**

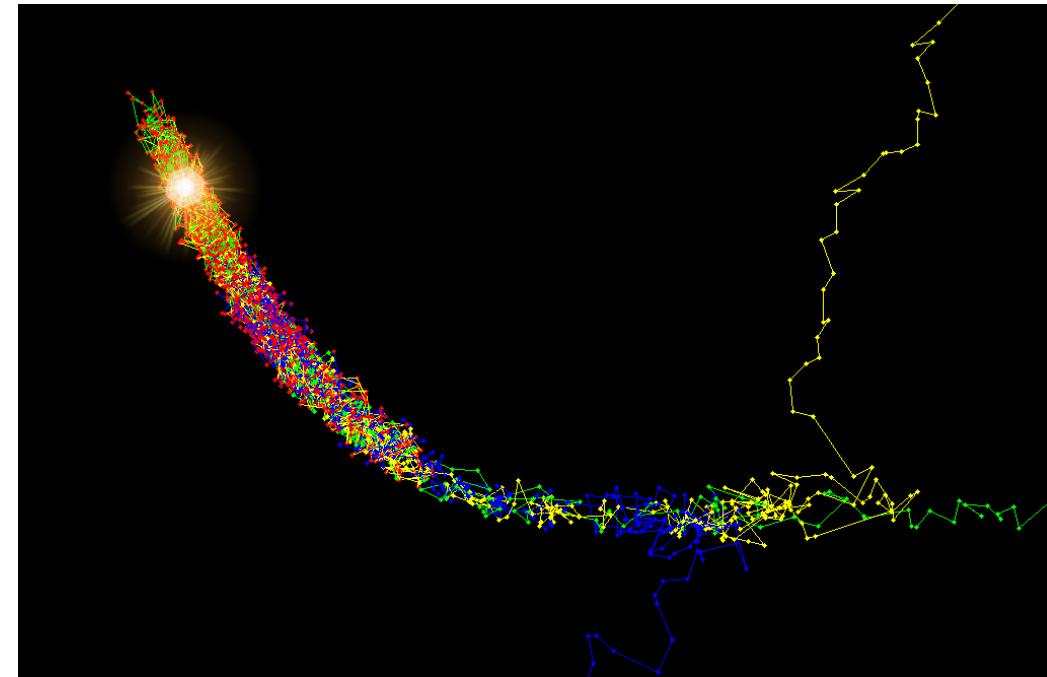

$$p(\theta | D) \propto p(D | \theta) p(\theta)$$

MCMC Sampling Algorithms

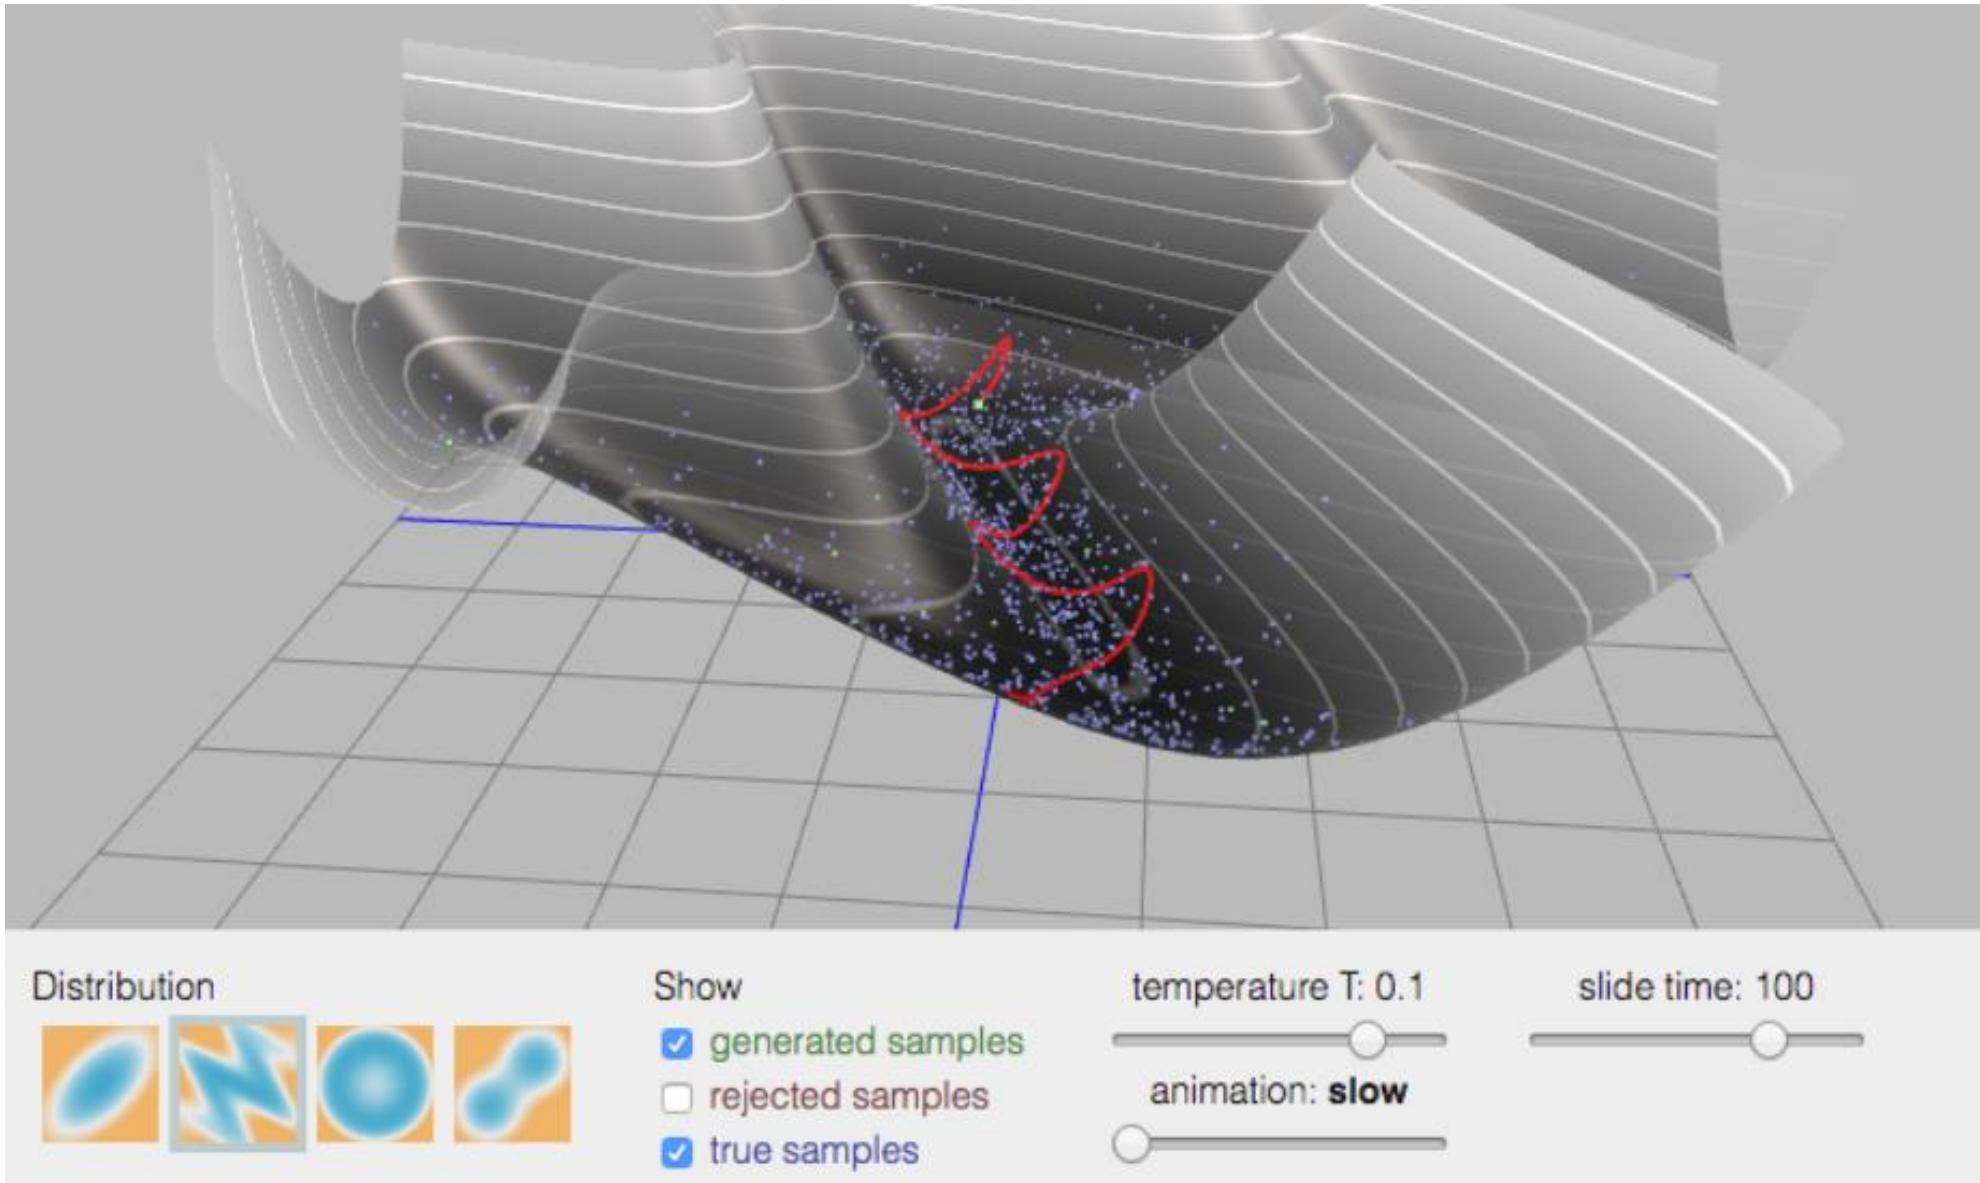

- Rejection sampling
- Importance sampling
- Metropolis algorithm
- Gibbs sampling → JAGS
- HMC sampling*

Stan!

build some intuition

Stan: A Probabilistic Programming Language

Carpenter, Bob; Gelman, Andrew; Hoffman, Matthew D.; Lee, Daniel; Goodrich, Ben; Betancourt, Michael; Brubaker, Marcus A.; Guo, Jiqiang; Li, Peter; Riddell, Allen

Grantee Submission, Journal of Statistical Software v76 n1 p1-32 Jan 2017

Stan is a probabilistic programming language for specifying statistical models. A Stan program imperatively defines a log probability function over parameters conditioned on specified data and constants. As of version 2.14.0, Stan provides full Bayesian inference for continuous-variable models through Markov chain Monte Carlo methods such as the No-U-Turn sampler, an adaptive form of Hamiltonian Monte Carlo sampling. Penalized maximum likelihood estimates are calculated using optimization methods such as the limited memory Broyden-Fletcher-Goldfarb-Shanno algorithm. Stan is also a platform for computing log densities and their gradients and Hessians, which can be used in alternative algorithms such as variational Bayes, expectation propagation, and marginal inference using approximate integration. To this end, Stan is set up so that the densities, gradients, and Hessians, along with intermediate quantities of the algorithm such as acceptance probabilities, are easily accessible. Stan can be called from the command line using the "cmdstan" package, through R using the "rstan" package, and through Python using the "pystan" package. All three interfaces support sampling and optimization-based inference with diagnostics and posterior analysis. "rstan" and "pystan" also provide access to log probabilities, gradients, Hessians, parameter transforms, and specialized plotting.

Who are using Stan?

Why Use Stan?

vs. BUGS / JAGS

- Less spatial correlation → effective samples
- Time to converge and per effective sample size:
1 - ∞ times faster
- Memory usage: 1–10%
- Language features
 - variable overwrite: `a = 4`, then `a = 5`
 - formal control flow (same as R)
 - full support of vectorizing & matrix calculation

Krzysztof Sakrejda
@sakrejda

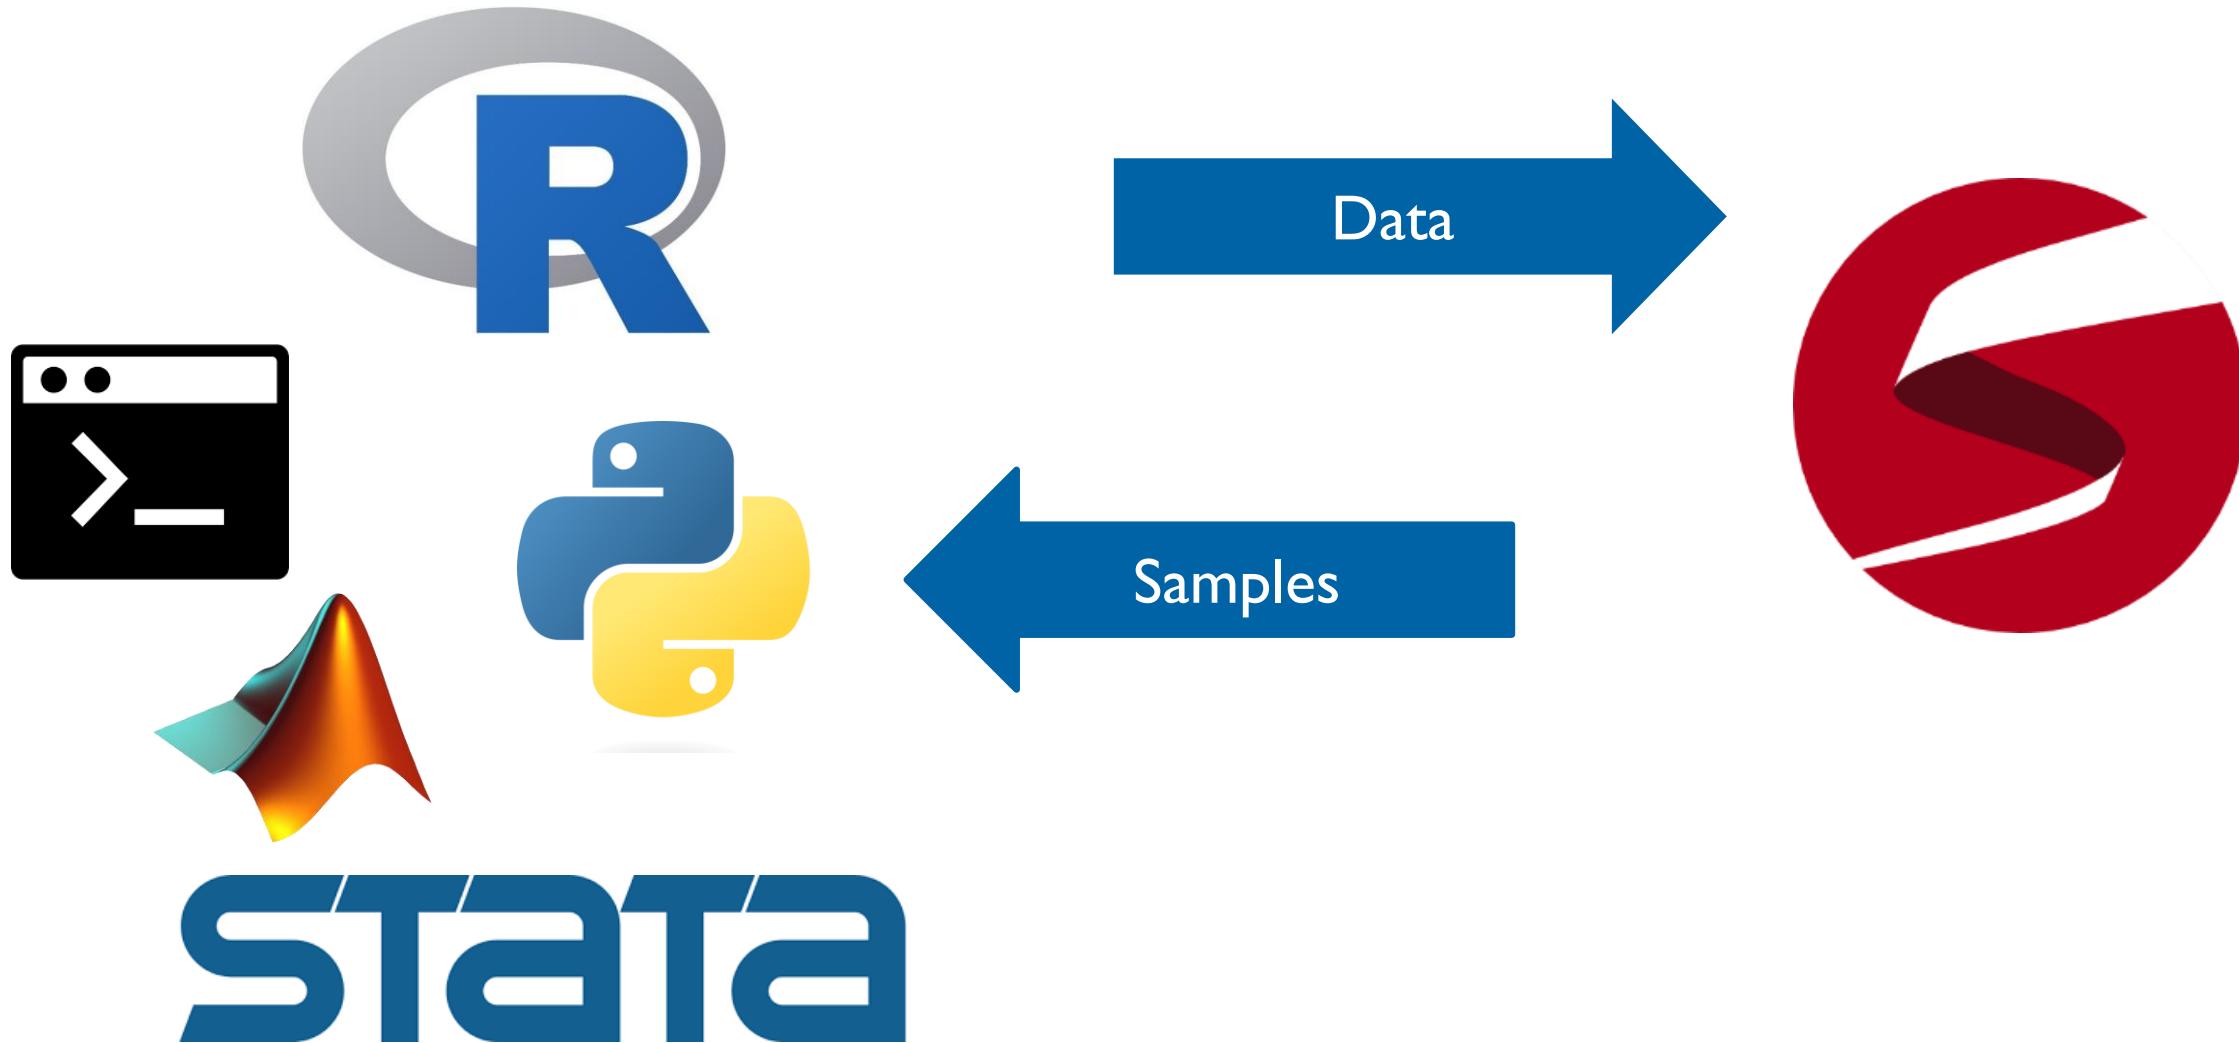

I keep getting asked why people should use [@mcmc_stan](#) so I wrote an answer:

"Selling" Stan
discourse.mc-stan.org

Stan and Other Platforms

Why Bayesian model estimation?

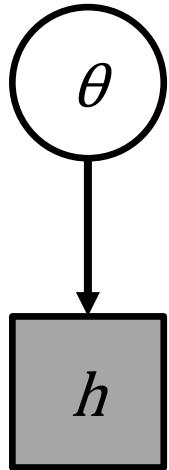

1. Not just a point estimate, but an entire **probability distribution over parameters**
2. Rather than only assuming participants are independent samples, we can model **hierarchical relationships**
3. Naturally avoid overfitting through **Bayesian Occam's Razor**, since we evaluate the model across the entire range of parameters

But, any cons?

- HMC provides huge improvements in computational efficiency, but **mathematical foundations** are more difficult to follow, at least sometimes.
- Stan cannot sample from the posterior distribution of **discrete parameters** (e.g., [1, 2]).
 - → with additional effort, it can be achieved through marginalisation, see the Stan User Manual.
- There are a few unwritten **tips and tricks**.
 - Practise makes perfect and follow discussions on the forum.
- **Block-based language** → might seem rigid in the first place.

A quick look at Stan

$\theta \sim \text{Uniform}(0, 1)$

$h \sim \text{Bernoulli}(\theta)$

```
data {  
    int<lower=0> N;  
    int<lower=0,upper=1> flip[N];  
}  
  
parameters {  
    real<lower=0,upper=1> theta;  
}  
  
model {  
    flip ~ bernoulli(theta);  
}
```

Stan Language

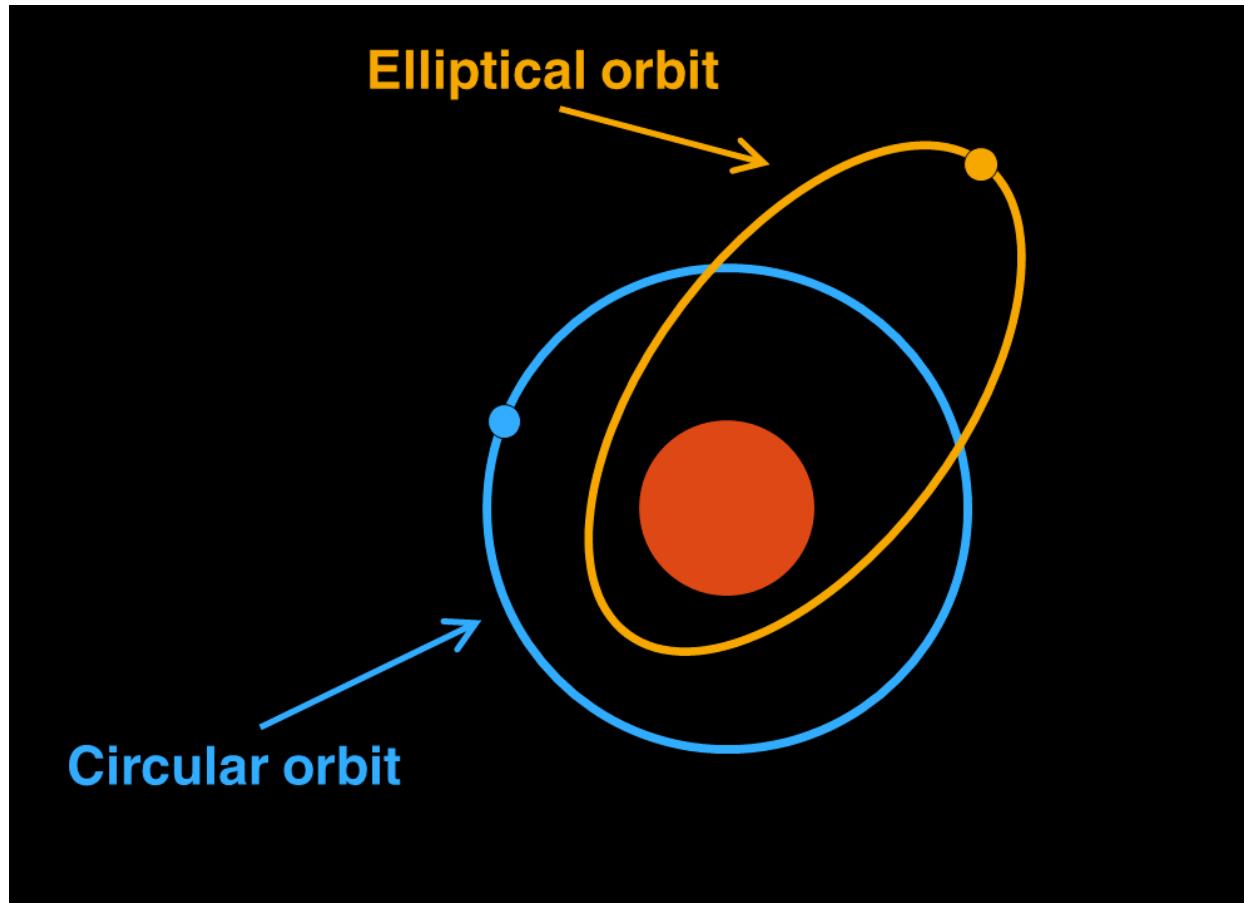

```
data {  
    //... read in external data...  
}  
  
transformed data {  
    //... pre-processing of data ...  
}  
  
parameters {  
    //... parameters to be sampled by HMC ...  
}  
  
transformed parameters {  
    //... pre-processing of parameters ...  
}  
  
model {  
    //... statistical/cognitive model ...  
}  
  
generated quantities {  
    //... post-processing of the model ...  
}
```

Reward Prediction error

Predicted reward trials

Simple reinforcement learning: 2-armed bandit task

a simple task often used in the laboratory:

- **repeated choice** between N options (**N-armed bandit**)
- ...whose properties (reward amounts, probabilities) are learned through **trial-and-error**
- ...with a **goal** in mind: maximize the overall reward

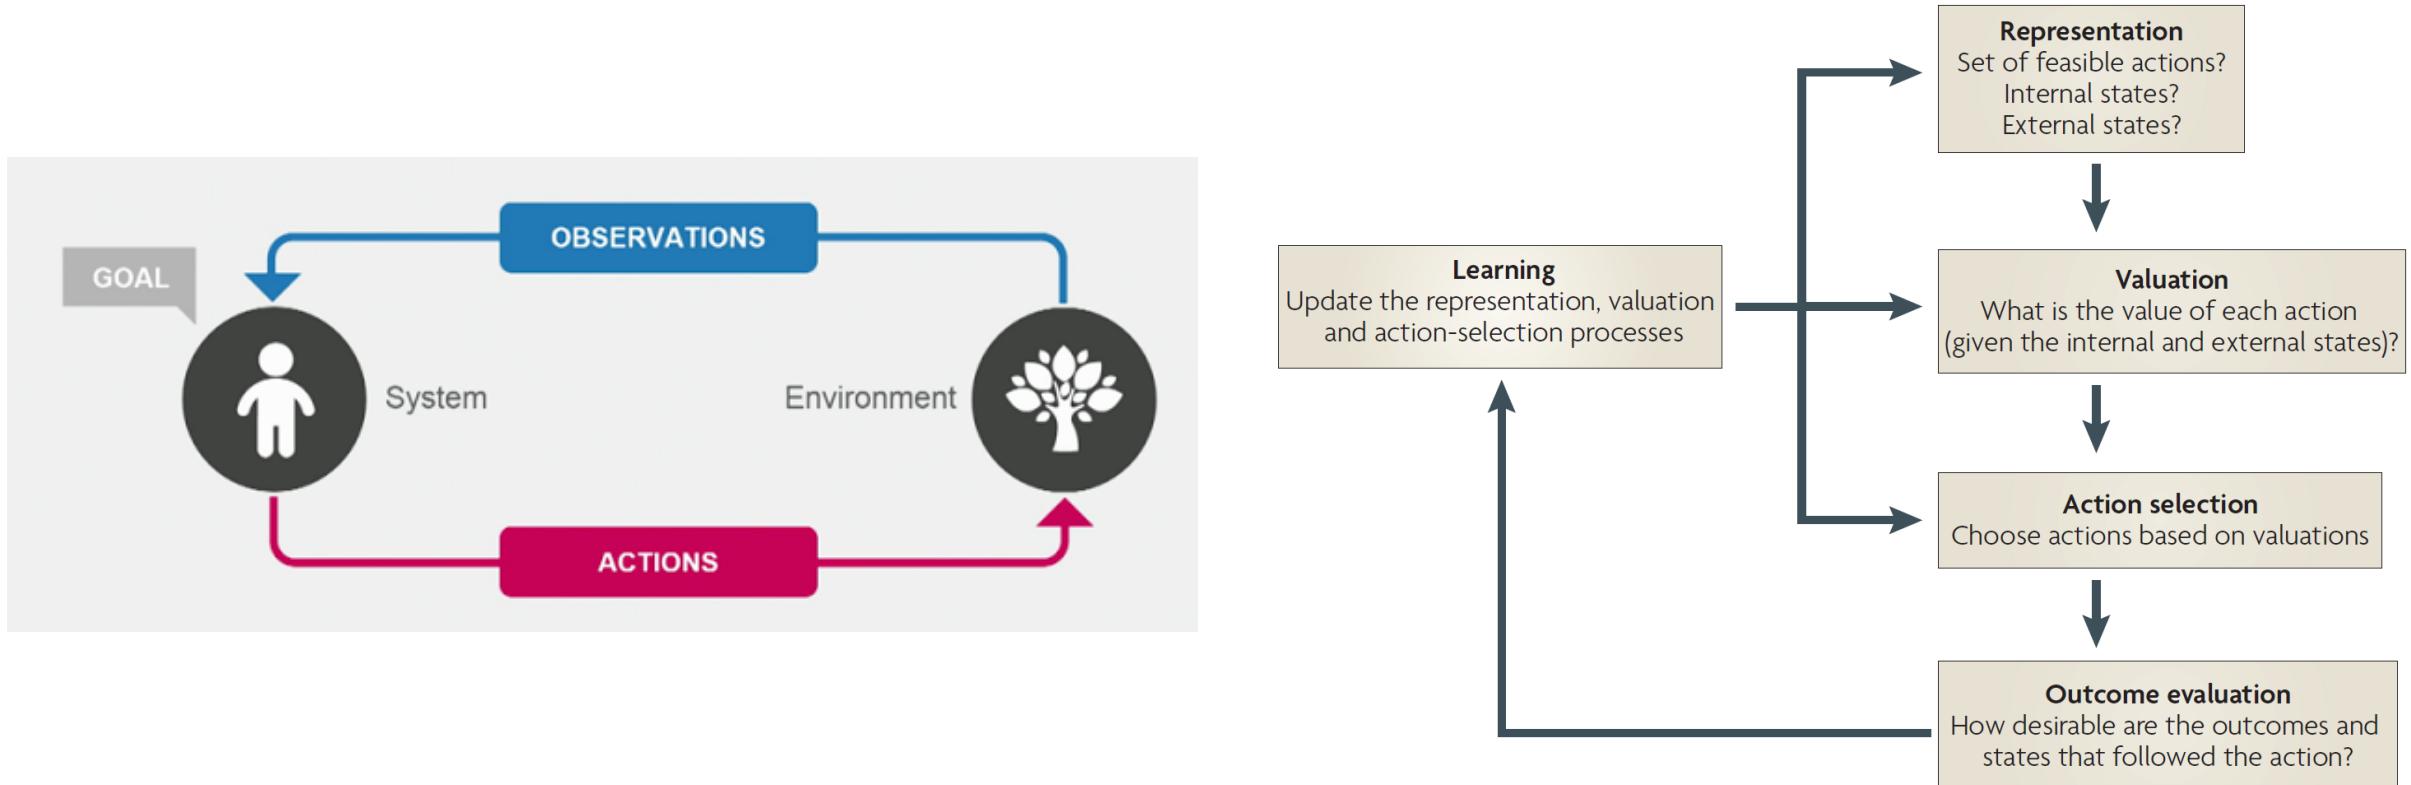

2-armed bandit task

What can be your **strategies**:

1. **predict** the value of each deck
2. **choose** the best
3. **learn** from outcome to update predictions
(repeat)

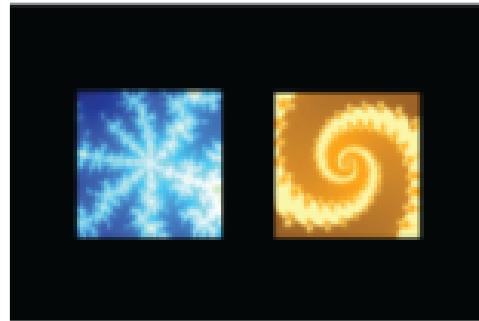

How is prediction shaped by learning?

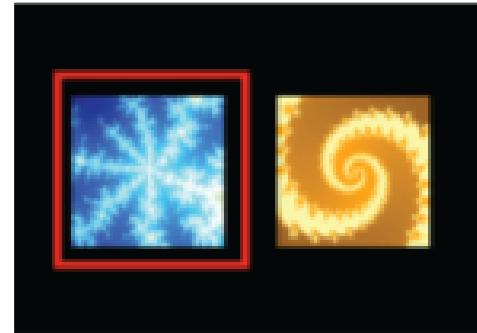

reward contingency 80:20

Social learning & decision-making

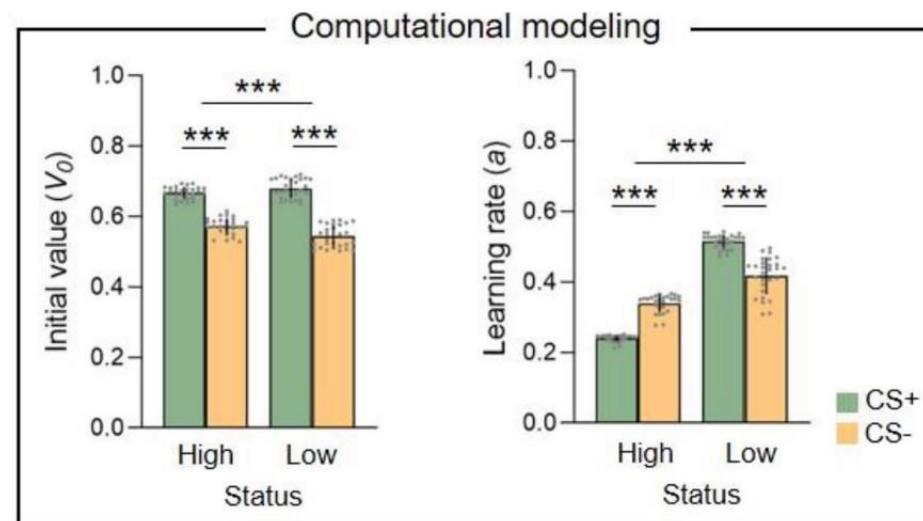

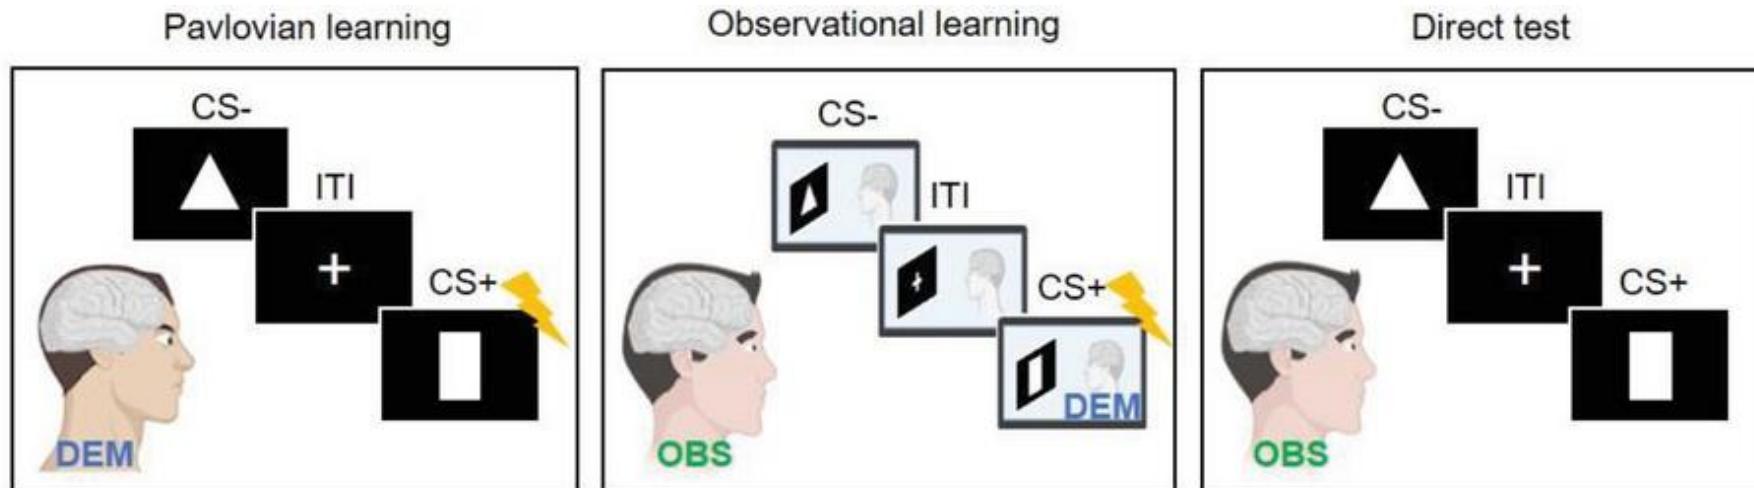

Decision-making stage (value type)	Target (and reference frame) of valuation		
	Value of other people (for oneself)	Value of other people's experiences (for them)	Value of social constellation (for normative social principle)
Choice (decision value and anticipated value)	Deciding whether to marry someone	Choosing a school for your child	Altruistic punishment of norm violations
Outcome (experienced value)	Being smiled at	Empathy with someone's pain	Enjoying fair distributions
Learning (anticipated value)	Learning about someone's trustworthiness	Learning about someone else's preferences	Changing your opinion to increase social conformity

learn from others (to benefit oneself)

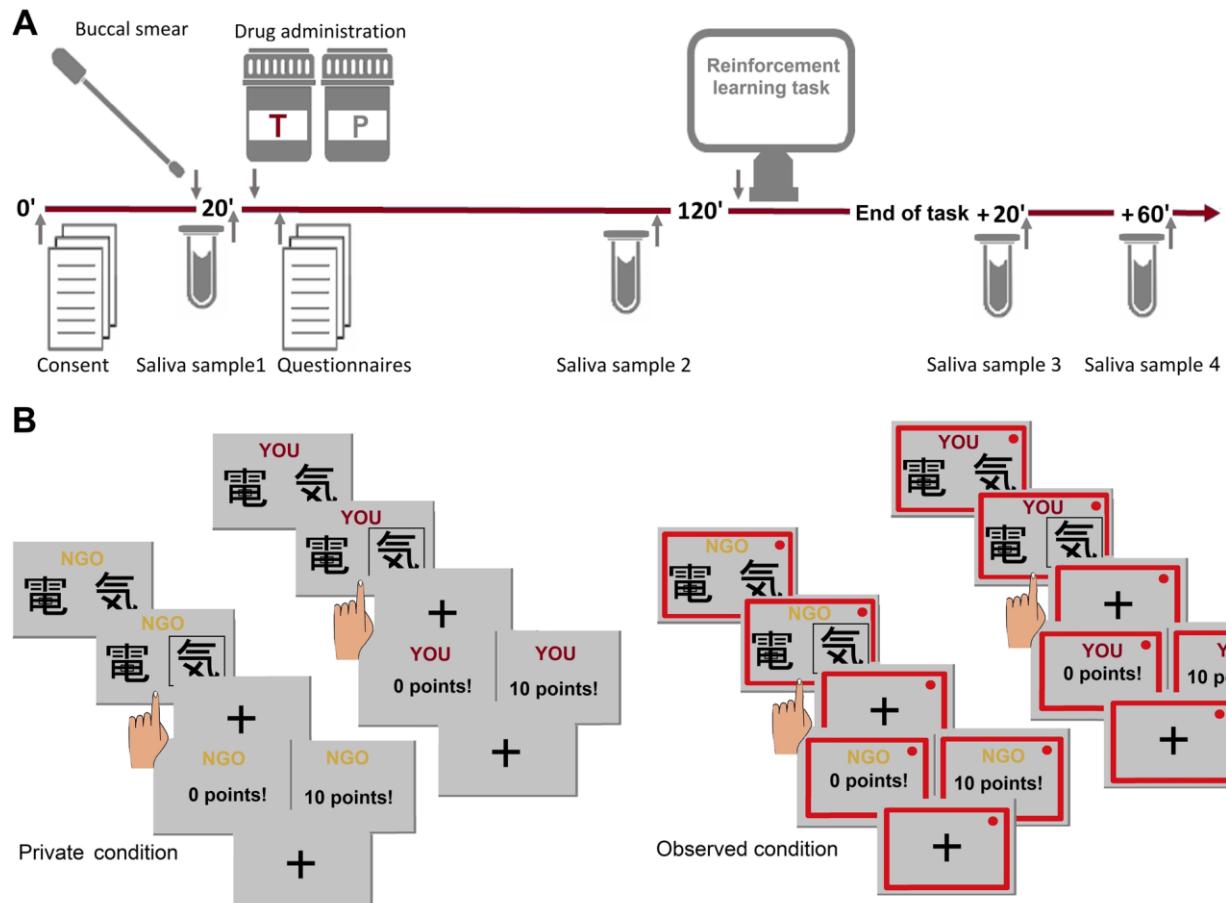

learn from others (to benefit oneself - fear)

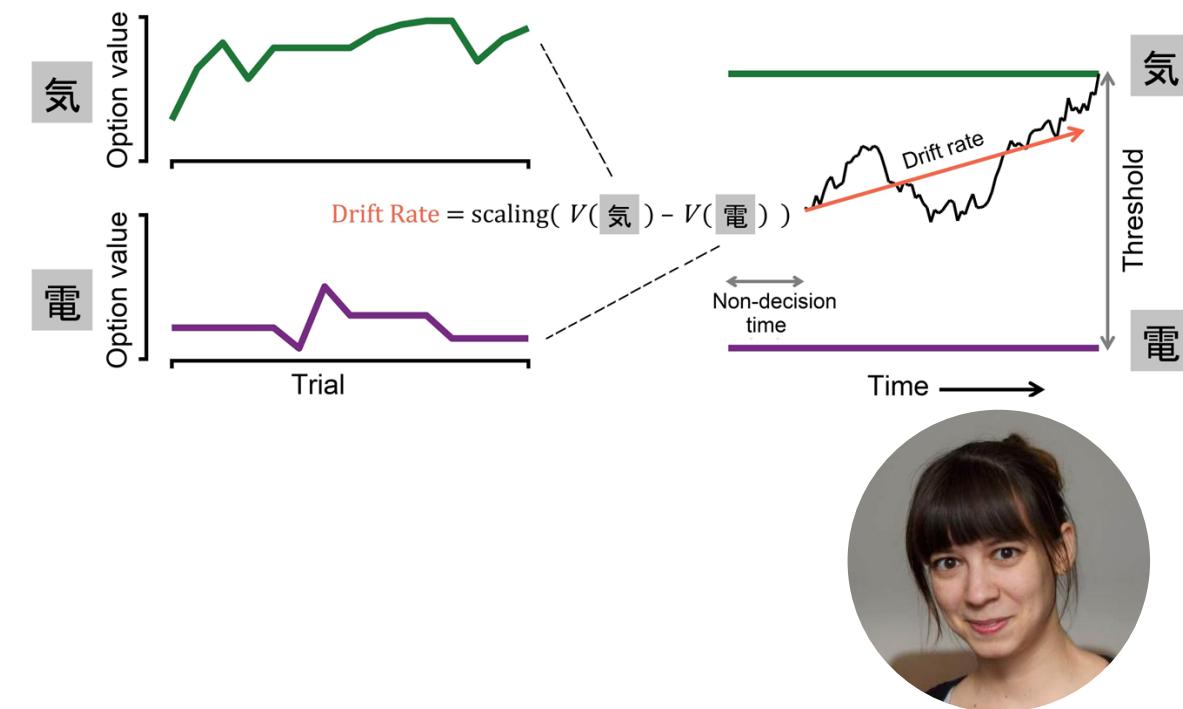

Yafeng Pan

learn for others (pro-social)

Reinforcement Learning Diffusion Decision Model (RLDDM)

Hana Kutlikova

Some more food for thought

What is a social RL task?

There are commonly two variations: either reward learning in social contexts (e.g. learn to expect monetary reward for a social partner) or social feedback learning (e.g. learn to expect social status or social evaluation). When the goal is to compare different types of feedback (e.g. social vs. non-social feedback), we suggest matching the feedback as closely as possible on ‘domain general’ properties, such as salience or preference

Lockwood et al., 2016; Will et al., 2017

Is the learning rate static across trials, or dynamically adapting along the course of the experiment?

The learning rate does not necessarily have to be constant. But in the case of the Rescorla–Wagner model (and related models), the learning rate is indeed static. A dynamic learning rate, however, is possible when other types of models are applied. Note that the interpretation of the learning rate we discussed in the main text is independent of this constant vs dynamic property

Li et al., 2011; Mathys et al., 2011

Is it possible to use RL models in the absence of choice data?

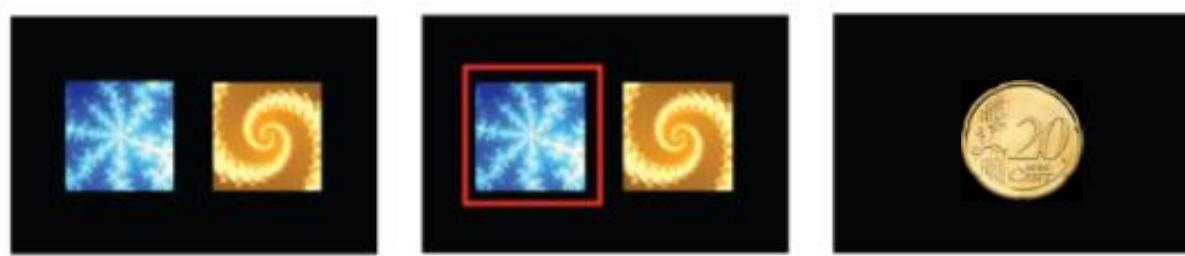

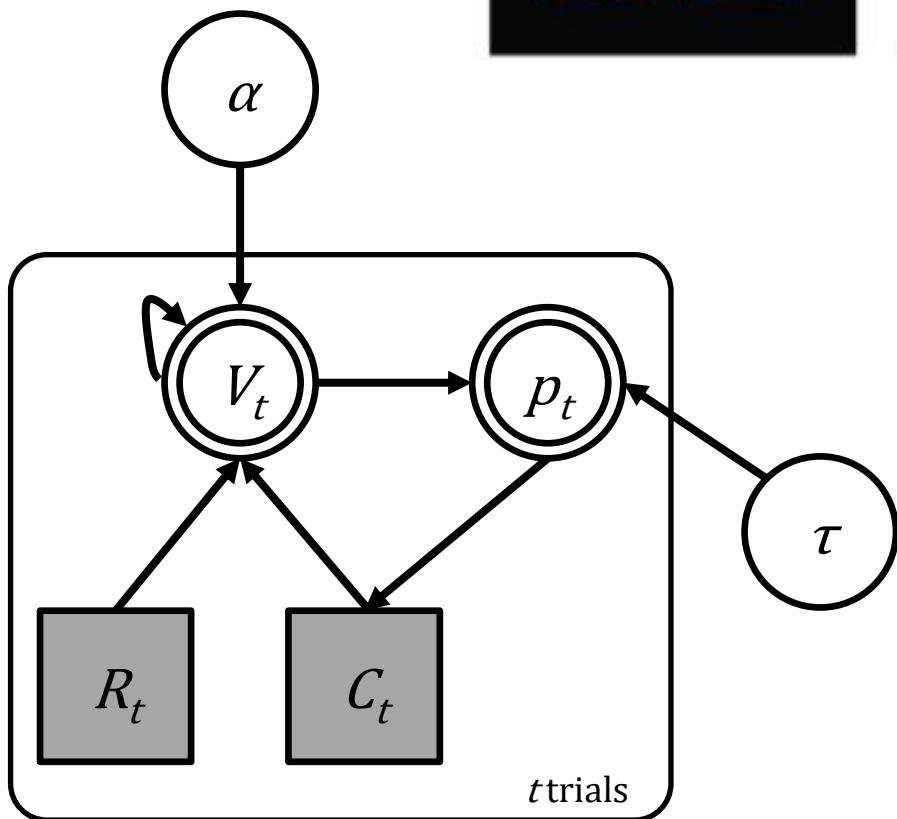

At least some sort of data is needed to perform model estimation. For example, skin conductance response (SCR) or pupil size response (PSR) have been used to fit RL models in associative fear learning tasks, where choice data was not available

Li et al., 2011; Tzovara et al., 2018

expected log pointwise predictive density

$$\widehat{\text{elpd}}_{\text{waic}} = \widehat{\text{lpd}} - \widehat{p}_{\text{waic}}$$

$$\begin{aligned}\widehat{\text{lpd}} &= \text{computed log pointwise predictive density} \\ &= \sum_{i=1}^n \log \left(\frac{1}{S} \sum_{s=1}^S p(y_i | \theta^s) \right).\end{aligned}$$

$$\begin{aligned}\widehat{p}_{\text{waic}} &= \text{estimated effective number of parameters} \\ &= \sum_{i=1}^n V_{s=1}^S (\log p(y_i | \theta^s))\end{aligned}$$

```
lpd <- log(colMeans(exp(log_lik)))
```

```
p_waic <- colVars(log_lik)
```

The {loo} Package

```
> library(loo)
> LL1    <- extract_log_lik(stanfit)
> loo1   <- loo(LL1)    # PSIS leave-one-out
> waic1 <- waic(LL1)   # WAIC
```

Computed from 4000 by 20 log-likelihood matrix

	Estimate	SE
elpd_loo	-29.5	3.3
p_loo	2.7	1.0
looic	58.9	6.7

Pareto Smoothed Importance Sampling

Recording the Log-Likelihood in Stan

```
generated quantities {
  ...
  real log_lik[nSubjects];
  ...

  { # Local section, this saves time and space
    for (s in 1:nSubjects) {
      vector[2] v;
      real pe;

      log_lik[s] = 0;
      v = initV;

      for (t in 1:nTrials) {
        log_lik[s] = log_lik[s] + categorical_logit_lpmf(choice[s,t] | tau[s] * v);

        pe = reward[s,t] - v[choice[s,t]];
        v[choice[s,t]] = v[choice[s,t]] + lr[s] * pe;
      }
    }
  }
}
```

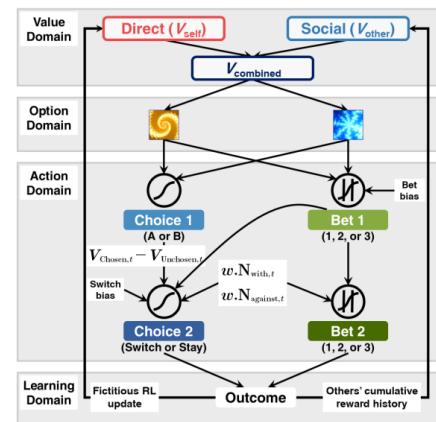

Outline

- Recap on Bayesian modeling
- Why Stan?
- What is (computational) cognitive modeling?
- The idea of the simple RL model
- Implementing RL model for one subject in Stan
- **Fitting multiple subjects with the hBayesDM package**
- Q&A

HBA sounds good, but...

$$\begin{aligned}
 \mu_\alpha &\sim Uniform(0,1) \\
 \sigma_\alpha &\sim halfCauchy(0,1) \\
 \mu_\tau &\sim Uniform(0,3) \\
 \sigma_\tau &\sim halfCauchy(0,3) \\
 \alpha_i &\sim Normal(\mu_\alpha, \sigma_\alpha)_{\mathcal{T}(0,1)} \\
 \tau_i &\sim Normal(\mu_\tau, \sigma_\tau)_{\mathcal{T}(0,3)} \\
 p_{i,t}(C = A) &= \frac{1}{1 + e^{\tau_i(V_{i,t}(B) - V_{i,t}(A))}} \\
 V_{i,t+1}^c &= V_{i,t}^c + \alpha_i(R_{i,t} - V_{i,t}^c)
 \end{aligned}$$

$$\begin{aligned}
 V_{self,t} &= [V_{self,t}(A), V_{self,t}(B)] \\
 V_{other,t} &= [V_{other,t}(A), V_{other,t}(B)] \\
 V_t &= \beta_{self} V_{self,t} + \beta_{other} V_{other,t} \\
 C1_t &\sim Categorical(Softmax(V_t)) \\
 U_{bet1,t} &= \beta_{bias_{self}} + \beta_{val_{diff}}(V_{chosen,C1,t} - V_{unchosen,C1,t}) \\
 B1_t &\sim OrderedLogistic(U_{bet1,t} | \theta) \\
 &\sum_{s=1}^K w_{s,t}, K = 0, 1, \dots, 4 \\
 w.N_{against,t} &= \sum_{s=1}^4 w_{s,t} \\
 w.N_{with,t} &= \sum_{s=1}^{4-K} w_{s,t} \\
 V_t(\text{switch}) &= \beta_{bias_{self}} + \beta_{val_{diff}}(V_{chosen,C1,t} - V_{unchosen,C1,t}) + \beta_{against} w.N_{against,t} \\
 C2 &\sim Bernoulli(V_t(\text{switch})) \\
 U_{bet2,t} &= \begin{cases} U_{bet1,t} + \beta_{with_{self}} w.N_{with,t} + \beta_{against_{self}} w.N_{against,t}, & \text{if } C1 = C2 \\ U_{bet1,t} + \beta_{with_{self}} w.N_{with,t} + \beta_{against_{switch}} w.N_{against,t}, & \text{if } C1 \neq C2 \end{cases} \\
 B2_t &\sim OrderedLogistic(U_{bet2,t} | \theta) \\
 \Phi(x) &= \frac{1}{1 + e^{-x}} \\
 \delta_{self,chosen,C2,t} &= R_{self,t} - V_{self,chosen,C2,t} \\
 \delta_{self,unchosen,C2,t} &= -R_{self,t} - V_{self,unchosen,C2,t} \\
 V_{self,chosen,C2,t+1} &= V_{self,chosen,C2,t} + \alpha \delta_{self,chosen,C2,t} \\
 V_{self,unchosen,C2,t+1} &= V_{self,unchosen,C2,t} + \alpha \delta_{self,unchosen,C2,t}
 \end{aligned}$$

hBayesDM package

hBayesDM

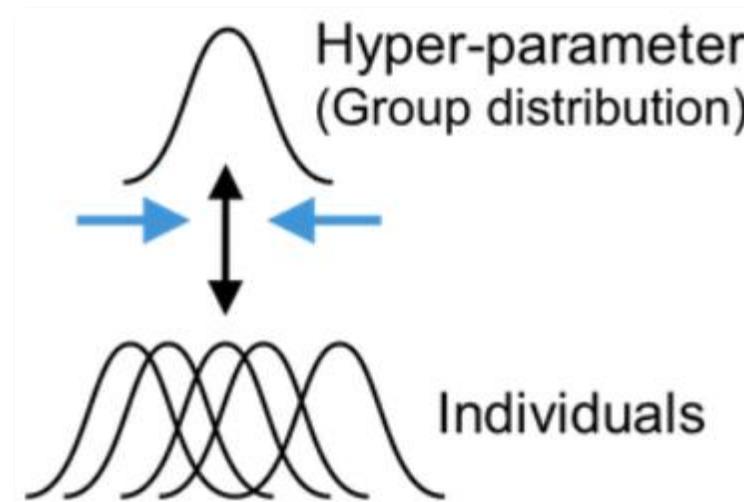

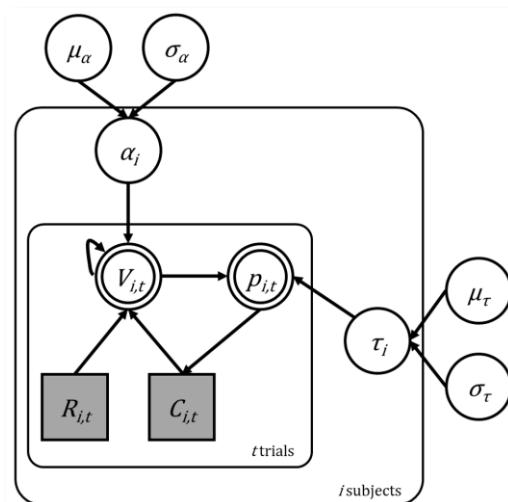

repo status Active build passing CRAN 1.0.2 – 2019-11-13 downloads 33K
DOI [10.1162/CPSY_a_00002](https://doi.org/10.1162/CPSY_a_00002)

hBayesDM (hierarchical Bayesian modeling of Decision-Making tasks) is a user-friendly package that offers hierarchical Bayesian analysis of various computational models on an array of decision-making tasks. hBayesDM uses Stan for Bayesian inference.

StanCon 2020, August 11-14 at Oregon State University

Announcements stancon

StanCon 2020 will be at Oregon State University! There will be two days of tutorials followed by two days of talks, open discussions, and statistical modeling. Up-to-date details at <https://mc-stan.org/events/stancon2020>. [read more](#)

 Welcome to the Stan Forums!

The Stan Forums provide a community for asking and answering questions about all aspects of Stan. Before creating a new topic please search the Forums to see if your question has already been answered, or check out the [read more](#).

Summary

- Computational modeling is never new → don't let it fear you!
- Learn some statistics (e.g., different statistical distributions)
- Learn some math (e.g., linear algebra)
- Learn some programming (e.g., R/Python/Julia/Matlab)
- Learn to seek external help (e.g., existing packages)
- Learn in pairs; practice makes perfect!

Richard McElreath
@rlmcelreath

I say this a lot, bc I am also confused quite often.

Anna Jacobson @AnnaChingChing · Feb 21

"If you are confused, it is only because you are trying to understand." -
